PROFESSIONAL SUMMARY

Cybersecurity & Forensic Computing graduate (BSc Hons, University of Portsmouth) with hands-on experience across malware reverse engineering, OSINT-driven threat detection, and practical penetration testing. Designed and evaluated a four-layer OSINT framework using a Random Forest classifier to detect fraudulent cryptocurrency websites with 91.4% accuracy across 875 real-world URLs, and conducted full static, dynamic, and reverse-engineering analysis of a live malware sample to uncover its command-and-control, persistence, and spyware behaviour. Comfortable working independently across forensics, network security, and secure development, with strong written communication for technical and non-technical audiences. Fluent in English and Arabic, with working Turkish. Seeking an entry-level security analyst, SOC analyst, or forensic investigator role.

TECHNICAL SKILLS

Malware & Digital Forensics: IDA Pro, PEiD, UPX/packer analysis, Wireshark, RegShot, Process Monitor, Volatility, memory & disk imaging, certutil

Penetration Testing: Nmap, Metasploit Framework, Google dorking / OSINT recon, DVWA, vulnerability scanning (Nessus), OWASP Top 10 methodology

Programming & Scripting: Python (pandas, scikit-learn, Requests, BeautifulSoup), Bash, PowerShell, x86 Assembly, regex

OSINT & Threat Intelligence: WHOIS / DNS / SSL infrastructure analysis, MITRE ATT&CK, blockchain & wallet tracing, GDPR-compliant risk scoring

Networking & Embedded Security: Network hardening, incident response, Arduino / IoT edge devices, MQTT over TLS, Scapy packet analysis

KEY PROJECTS

Cryptocurrency Investigative OSINT Framework (CIOF) — Final Year Dissertation 2026

- Designed a four-layer OSINT framework (infrastructure, on-site content, social footprint, blockchain) to investigate fraudulent cryptocurrency websites.
- Trained a Random Forest classifier (scikit-learn) on 875 real labelled URLs, achieving 91.4% accuracy and a 0.925 F1-score.
- Cross-referenced extracted wallet addresses against the Real-CATS dataset of 90,000+ flagged criminal cryptocurrency addresses.
- Produced graduated risk classifications (Legitimate / Suspicious / Scam) with inspectable, evidence-based output instead of a black-box verdict.

Malware Forensic Investigation — Simulated Insider Threat Case 2025

- Performed static analysis in IDA Pro on a UPX-packed sample, identifying hardcoded C2 infrastructure, persistence, and anti-analysis strings.
- Validated findings dynamically: Wireshark confirmed IRC-based C2 traffic; RegShot proved registry-based persistence.
- Reverse-engineered the binary to map specific API calls (RegSetValueExA, InternetOpenA, BitBlt) to persistence, C2, and screen-capture spyware behaviour.
- Delivered a full indicator-of-compromise list and a remediation and hardening plan for the simulated client.

CyberLight — Physical IoT Network Attack Visualisation System 2026

- Built a low-cost (~£37) Arduino-based device that turns invisible network attacks into physical alerts via LED, LCD display, and buzzer.
- Wrote a Python/Scapy monitoring layer to detect port scans, rogue devices, brute-force logins, and unencrypted services in real time.
- Published all detection events to a cloud MQTT broker over TLS, providing a persistent, remotely accessible audit log.

Practical Penetration Testing & Vulnerability Research 2025

- Remediated a command-injection vulnerability in a PHP DNS lookup tool by replacing unsafe shell execution with validated, native function calls.
- Used Google dorking for OSINT reconnaissance, identifying exposed credentials and admin login pages on test infrastructure.
- Exploited a file-upload vulnerability to establish a reverse shell via Netcat against a deliberately vulnerable web application.

- Mapped three real-world WooCommerce CVEs (SQL injection, XSS, broken access control) to the OWASP Top 10 with code-level mitigations.
- Completed a TryHackMe CTF end-to-end — reconnaissance, exploitation, and privilege escalation — capturing both user and root flags.

PROFESSIONAL EXPERIENCE

Cybersecurity & Information Systems Intern — Vision Energy Industrial LLC *Jun – Aug 2025*
Dammam, Saudi Arabia

- Supported system and network security operations within the Cybersecurity & Information Systems department.
- Assisted with monitoring and analysis activities to help identify potential security issues.
- Participated in security-related projects and team initiatives alongside department staff.
- Contributed to policy implementation and security awareness efforts.

EDUCATION

BSc (Hons) Cybersecurity & Forensic Computing — University of Portsmouth *2022 – 2026*

Relevant coursework: Digital Forensics, Ethical Hacking, Cyber Threat Intelligence, Incident Response, Business Information Security Systems, CyberLaw Governance & Human Rights.

Cambridge International A-Level & IGCSE

2019 – 2021

Top grades in Science and Mathematics.

CERTIFICATIONS

- CompTIA Security+ — In Progress
- Certified Ethical Hacker (CEH) — Planned

LANGUAGES

Arabic (native) | English (advanced, IELTS) | Turkish (intermediate)
